WINTER-19 EXAMINATION MODEL ANSWER

Subject: Highway Engineering

Subject Code-

22302

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors etc... should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgment on part of examiner of relevant answer based on candidate's understanding.

7) For programming language papers, credit may be given to any other program based on equivalent concept.

	ec	uivalent concept.		
Que.	Sub	Anguan	Marking	Total
No.	Que.	Answer	Scheme	Marks
1		Solve any FIVE:		10
	a) Ans.	State any four modes of transportation Four modes of transportation are: a) Roadways or Highways b) Railways c) Waterways d) Airways.	½ mark each	2
	b) Ans.	Classify the roads according to Nagpur Road Development plan. According to Nagpur plan, roads are classified as: 1) National Highway (NH) 2) State Highway (SH) 3) Major District Road (MDR) 4) Other District Road (ODR) 5) Village Road (VR	2	2
	c) Ans.	State any two requirements of a Ideal road alignment a) Crossing: The provision of railway and road crossing should be properly studied. Dangerous road and rail crossing should be avoided. b) Proper drainage: The provision of proper and sufficient drainage is necessary for the stability of the road and hence the road alignment should take into consideration factors like rain water, ground water etc c) Availability of local materials: For reducing the cost of construction and maintenance, it is necessary to have easy availability of natural materials like sand, gravel, soil etc	2 marks (any two)	2

		(ISO/IEC - 2/001 - 2013 Certified)	1	
		d) The road should have good visibility at night and other climatic conditions		
		e) The alignment should be such that sufficient safety should be there while		
		travelling on the road		
		f) The road should connect important points like school, places of tourist's		
		importance etc		
_		g) The road should be such that the slope and curves are easy.		
1		h) It is desirable to have short distance between the two terminal stations.		
		i) It should provide economy in the cost of construction and maintenance.		
		j) The alignment should be safe for traffic operation.		
		k) The alignment should provide maximum utility by connecting important towns		
		and group of villages.		
		1) The alignment should pass through regions of natural beauty and scenery to		
_		have good natural aspects		
	d)	Define traffic volume and traffic density		
	Ans.	Traffic Volume: It is the number of vehicles moving in a specified direction on a		2
		given lane or roadway that pass a given point or cross section during specified unit	1	4
		of time	1	
		Traffic Density: It is the number of vehicles occupying a unit length of lane of		
		roadway at a given instant usually expressed as vehicles per km.	1	
-	e)	Enlist any four types of traffic islands		
	Ans.	a) Divisional Island.	½ mark	
	711150	b) Pedestrians Loading Islands		
		c) Channelized Intersections	each	2
		d) Roundabouts or Rotaries		
-	f)	State any two causes of landslides		
	Ans.	Causes of Landslides:		
	71115.	a) Increase in the water content of the soil		
		b) Improper drainage system		
		c) Increase in the weight due to accumulation of snow and external loads due to		
		traffic	1 mark	
		d) Undermining caused by erosion or extraction		2
		e) Vibration and shocks caused by blasting or earthquakes	each	
		f) Hair cracking due to alternate swelling and shrinkage of the soil mass	(Any two)	
		g) Formation of faults in bedding planes of strata due to vibrations.		
		h) Due to seepage pressure of percolating ground water		
		i) Due to failure of breast wall		
ļ	g)	State the types of drainage system		
	Ans.	In plain areas,		
	111150	a) Surface Drainage b) Sub-surface Drainage	2	
		Surface Drainage: Side drains, Catch water basin, Inlet	2	
		Sub surface: Cross Drains, lateral drain, longitudinal drain, transverse drain		
		OR	OD	4
		In Hilly areas,	OR	
		a) Surface Drainage b) Sub-surface Drainage		
		a) Surface Drainage: Side drains, catch water drain		
		b) Sub surface drainage: Cross drains	2	
ı		, ,	1 1	

2 Solve any THREE: a) Define gradient and state any four types of gradient. The rate of rise and fall along the length of road w.r.t. horizontal surface is called as Gradient. OR The longitudinal slope provided along the length of road, is known as Gradient. Types 1) Ruling gradient 2) Limiting gradient 3) Exceptional gradient 4) Average gradient 6) Minimum gradient 9) Define 1) Stopping Sight distance 1) Stopping Sight distance 1) Stopping Sight distance 1) Stopping Sight Distance: SSD may be defined as the longth of highway required to bring a vehicle to stop at various design speeds when the eye of the driver is 1200mm above the pavement and the object causing the stop is 150mm above the pavement. Or The driver of the vehicle should be able for see clearly at least a certain portion of the road length to avoid collision or accident. This absolute minimum length required for this purpose is known as Stopping Sight Distance ii) Overtaking Sight Distance: OSD may be defined as the minimum distance open to the vision of the driver of a vehicle intending to overtake the slow vehicle ahead safely against the traffic in the opposite direction. c) Draw a neat sketch of std. C/s of National Highway in embankment. Cross-section of National Highway in embankment: 2 marks for sketch 2 marks for sketch 2 marks for labeling		ı	(ISO/IEC - 27001 - 2013 Certified)		
a) Define gradient and state any four types of gradient. The rate of rise and fall along the length of road w.r.t. horizontal surface is called as Gradient. OR The longitudinal slope provided along the length of road, is known as Gradient. Types 1) Ruling gradient 2) Limiting gradient 4) Average gradient 5) Floating gradient 6) Minimum gradient b) Define i) Stopping Sight distance ii) Overtaking sight distance ii) Overtaking sight distance: ii) Overtaking sight distance solve the pavement and the object causing the stop is 150mm above the pavement. Or The driver of the vehicle should be able to see clearly at least a certain portion of the road length to avoid collision or agrident. This absolute minimum length required for this purpose is known as Stopping Sight Distance ii) Overtaking Sight Distance: OSD may be defined as the minimum distance open to the vision of the driver of a vehicle intending to overtake the slow vehicle ahead safely against the traffic in the opposite direction. c) Draw a neat sketch of std. C/s of National Highway in embankment. Cross-section of National Highway in Embankment. Cross-section of National Highway in Embankment. 2 marks for labeling

	d)	State any two merits and demerits of WBM road.		
	Ans.	Merits of WBM roads: 1) If in good condition, it can take a composite traffic of	2	
		about 900 tonnes per lane per day	-	
		2) If WBM surfacing is maintained properly, it is found to have good service for a	(Any two)	
		long-time.	-	
		3) Their initial cost is low.		
				4
		4) They make use of the locally available materials.		4
		Demerits of WBM: 1) The maintenance cost is more.	2	
		2) If not maintained properly, then it causes inconvenience and danger to traffic.		
		3) They are permeable to rain water and it leads to the softening and yielding of	(Any two)	
		materials		
		4) Life is less		
3		Solve any THREE:		12
	`	•		
	a)	Write the procedure of construction of cement concrete pavement showing its		
		components.		
	Ans.	Construction procedure of Concrete Roads:		
	11115.	1) Preparation of subgrade by proper compaction		
		2) Provision of sub base to support subgrade		
		3) Placing of forms i.e. Steel channels		
		4) Batching and mixing of materials in plant		
		5) Transportation and placing of concrete through RMC vehicle	3	
		6) Compaction of poured concrete using vibrators		
		7) Floating of concrete using steel beam		4
		8) Brooming of concrete surface using steel brush		
		9) Edging of concrete for obtaining sharp edges		
		10) Curing of road surface by ponding method		
		11) Filling of joints using joint sealers		
		12) Opening of traffic after cleaning		
		12) Opening of traffic after cleaning

		roads			
	Ans.	Alignment of hill roads	Alignment of plain roads		
		1. Sharp curves are to be provided	1. Sharp curves are not to be provided		
		2. Cost of construction is more	2. Cost of construction is		
			comparatively less	1 mark	
		3. Proper care has to be taken for	3. Drainage does not cause that much	each	4
		drainage	problem as compared to hill roads	(Any four)	
		4. Stability is more important due to	4. There is not much problem of		
		problem of landlsides	landslides.		
		5. Here, more cutting and filling takes	5. Comparatively, less cutting and		
		place	filling takes place		
		6. Slope/ gradient is more	6. Slope/Gradient is less		
		7. Alignment is difficult	7. Alignment is easy		

	(ISO/IEC - 2/001 - 2013 Certified)		12
	Solve any THREE		12
a)	State any four preventive measures of landslides in hilly roads		
Ans.	 a) By providing proper and effective drainage system to intercept and divert seeping water b) By constructing buttress at toe and providing retaining structures c) By providing slopes and their treatment to minimize the erosion d) By providing soil stabilization e) By reducing the angle of slopes 	1 mark each (Any four)	
b)	f) By stone pitching. g) By providing nets. h) Chemical treatment. i) Growth of vegetation on the slopes. Draw labeled sketches of side drains along hill roads.		4
Ans.	LStone Pitching Stone Pitching Stone Pitching	3 marks each and 1 mark for labelling	4
	Angle Drain Saucer Drain Kerb & Channel Drain		
c) Ans.	State any four causes of failure of rigid pavement 1) Defective drainage system may lead to failures in rigid pavements such as mud pumping 2) Use of nondurable materials which start deteriorating during weathering cycles. 3) Improper alignment of dowel bars may lead to stress concentration and cracking near the joints. 4) Defects in construction method and quality control during construction. 5) Increase in the magnitude of wheel loads and the number of load repetitions, exceeding the design values. 4) Structural inadequacy of the pavement structure 5) Inadequate compaction of embankment or subgrade or settlement of embankment foundation itself, which could result in settlement of the supporting layers of the rigid pavement	1 mark each (Any four)	4
d)	Prepare a chart showing schedule of maintenance operation from October to		
	March for bituminous road.		
Ans.	i) Repairing of patch works ii) Renewal of coats iii) Repairing of damages caused by rains iv) Repairing of scours in culverts and cleaning of silts if any	2	
	v) Attending road signs, kilometer stones, boards etc.		4

		January to March i) Repairing of patchwork		
		ii) Repairing and inspection of gang huts	2	
		iii) Renewal and improvement works	2	
	e)	Justify the remedial measures for the following defects in earthen road:		
		i) Formation of dust during dry weather		
		ii) Growth of vegetation inside drains and their silting up		
	Ans.	i) Formation of dust during dry weather:		
		The dust nuisance may be remedied by the following methods:	4 1	
		Frequent sprinkling of water	1 mark each (Any	
4		Treatment with calcium chloride	two)	
		Use of other dust palliatives	,	
		Use of other material like tar, oil etc		4
		ii) Growth of vegetation inside drains and their silting up:		
		The growth of vegetation inside drains should be regularly cleaned either manually	2	
		or by using machines in order to increase the capacity of the flowing water in the		
		drain. Silting up of weeds, plants, bushes etc. causes obstruction in the flow of water.		
5		Solve any TWO:		12
	a)	Enlist three types of curves provided on hill roads. Draw neat sketch of them		
	Ans.	The three types of curves in hill roads are-		
		a) Hair –Pin Curves		
		b) Salient Curves	1	
		c) Re-entrant		
		PARAPET		
		6	5	
			(4 marks for sketch	
		HAIR PIN BEND	one mark	6
			for	
		ROAD A MIN PARAPET	labelling)	
		STOR GUTTER ROAD		
		HILL STDE Salient Salient Salient Curre		
		IMPROVE VISIBILITY IMPROVE VISIBILITY		
		- HILLADAD		
		Re-entrant curve		
		RE-ENTRANT CURVE		
		(Note: All the above three diagrams are to be drawn)		

	b)	Calculate the design speed of a vehicle on a horizontal curve having radius of		
	(U)			
		100m. with permissible super elevation of 7%. Consider co efficient of friction		
		0.8.		
		Super elevation = $7\% = \frac{7}{100} = 0.07$.		
	Ans.			
		R = 100 m.		
		f = 0.8.		
		V^2	1	
		$e + f = \frac{V^2}{127 R}$	_	
		127 K		
		V^2	1	
		$0.07 + 0.18 = \frac{V^2}{127 \ X \ 100}$		
		127 X 100		
		$V^2 = (0.07 + 0.18) \times (127 \times 100)$	2	
		$=(0.25)\times(12700)$		
		= 3175		
		$V = \sqrt{3175} = 56.34 \text{ km/hr}.$	2	
	c)			
		State the requirement of good quality material which plays the major role in		
	Ans.	highway construction		
5		The materials which plays major role in highway construction are:		
3		a) Soil		
		b) Bitumen		
		c) Cement		
		d) Stone		
		e) Concrete		
		f) Sand		
		Requirements:		
		a) Soil:		
		i) It should be clean and coarse.		
		ii) It should be free from any organic or vegetable matter;	3 marks	
		iii) It should be chemically inert.	each	
		v) It should not contain salts which attract moisture from the atmosphere.	(for any	
		vi) It should be well graded, i.e., it should contain particles of various sizes in	three type	6
		suitable proportions.	of	6
		vii) It should be strong and durable. It should be clean and free from coatings of	materials)	
		clay and silt.		
		b) Bitumen:		
		i) The bitumen should not be highly temperature susceptible		
		ii) During the hottest weather the mix should not become too soft or unstable		
		iii) During cold weather the mix should not become too brittle causing cracks.		
		iv) The viscosity of the bitumen at the time of mixing and compaction should be		
		adequate. This can be achieved by use of cutbacks or emulsions of suitable grades		
		or by heating the bitumen and aggregates prior to mixing.		

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

v) There should be adequate affinity and adhesion between the bitumen and aggregates used in the mix.

c) Cement:

- i) The color of the cement should be greenish grey.
- ii) Cement should give a cool feeling when hand is thrusted into the cement bag
- iii) Cement should give smooth feeling when rubbed between two fingers
- iv) When cement is thrown into a bucket of water it should float for some time and then sink
- v) There should not be presence of lumps

d) Stone:

- i) It should be descent in appearance and have uniform colour.
- ii) It should be durable i.e. it should resist atmospheric action and should be long lasting
- iii) For a good stone, the crushing strength should be more than 100 N/mm²
- iv) Stones should be such that they can be dressed easily and economically.
- v) For a good building stone, the specific gravity should be more than 2.7
- vi) The percentage of water absorption of water by weight after 24 hours should not exceed 60%.
- vii) Minerals in stones should be such that it should eatch fire easily.
- viii) Stones should be well seasoned before use.

e) Concrete:

- i) It should have good workability so that it can be easily handled and placed in position.
- ii) It should be dense and compact.
- iii) It should have enough compressive strength.
- iv) It should be durable.
- v) It should be resistant to fire.
- vi) It should be impermeable.
- vii) It should form hard surface capable of resisting abrasion.
- viii) It should have minimum shrinkage.
- ix) It should be economical.

f) Sand:

- It should be clean and coarse.
- ii) It should be free from any organic or vegetable matter;
- iii) It should be chemically inert.
- iv) It should contain sharp, angular, coarse and durable grains.
- v) It should not contain salts which attract moisture from the atmosphere.
- vi) It should be well graded, i.e., it should contain particles of various sizes in suitable proportions.
- vii) It should be strong and durable. It should be clean and free from coatings of clay and silt.

			12
Ans. v a	Write the procedure of construction of WBM road with neat sketch showing rarious components Construction Procedure: a) Preparation of Foundation: The foundation for receiving the layer of WBM may be either the sub-grade or sub-base or base course. The depressions and bot holes on the existing road surface are filled up and the corrugations are removed by scarifying and reshaping the surface to the required grade and reshaping camber		
a b continue of the continue o	Spreading of coarse aggregate: The coarse aggregate is spread uniformly on the prepared base. The WBM course is normally constructed to compacted hickness of 7.5cm. Rolling: After spreading the coarse aggregates properly, compaction is done by a three wheeled power roller of capacity 6 to 10 tonnes or alternatively by an equivalent vibratory roller; the weight of the roller depends on the type of coarse aggregates. The rolling is done until adequate compaction is achieved. Application of Screenings: After the coarse aggregates are rolled adequately, the dry screenings are applied gradually over the surface to fill the interstices (Voids) in three or more applications. Dry rolling is continued as the creenings are being spread and brooming is carried out. Sprinkling and Grouting: After the application of screenings, the surface is sprinkled with water, swept and rolled. Wet screenings are swept into the voids using hand brooms. Additional screenings are applied and rolled till the coarse aggregates are well bonded and firmly set. Application of binding materials: After the application of screening and colling, binding material is applied at a uniform and slow rate at two or more uccessive thin layers. After each application of binding material, the surface is copiously sprinkled with water and wet slurry swept with brooms to fill the voids. This is followed by rolling with a 6 to 10 tonnes roller and water is applied to the wheels to wash down the binding material that sticks to the roller. When crushable type screenings like moorum or gravel are used, there is no need to apply binding materials, except in the surface course.	4	6
